<i>Foreword by Alvaro Cencini and Xavier Bradley</i>	xiii
<i>Foreword by the author</i>	xxvii
General introduction	1
1 Production and time	3
2 Expenditures and time	20
3 Production and expenditure constitute one unique event: the emission	29
PART I	
The functioning of the domestic economy: from wages to capital	31
4 From production to consumption: the creation and destruction of wages	33
5 Capital	84
PART II	
The dysfunction of the domestic economy: from capital to capitalism	103
6 The quantitative theory and the quantum theory of inflation	105
7 Inflation and unemployment have the same aetiology: empty emissions	111
8 The two benign cases of empty emissions or of inflation	113

9	It is precisely because fixed capital is the property of a non-person (the disembodied set of firms), that its amortization causes the malignant emissions	127
10	In the most advanced capitalism, a third of the industries in the country issue empty wages	138
11	The malignant emissions and unemployment	145

PART III

The remedies usually proposed, their inefficiency evaluated in the light of the theory of emissions

12	Money does not circulate in the economy	151
13	Far from being independent from each other, global supply and demand are logically merged into one unique magnitude; only confusion in the mind can separate them	160
14	Inflation and unemployment are totally independent from the behaviour of economic agents	170

PART IV

The solution is in the division of the activity of banks in three departments. Liberated from empty emissions, the domestic economy follows Say's law: it ensures full employment

15	The division of banks in two departments	195
16	The economy equipped with a network of deposit banks all divided into three departments will be totally free from empty emissions	205

PART V

General conclusion: the micro-macro distinction in economic analysis

17	Macroeconomics is the domain of absolute exchanges	217
18	Confrontation between the two paradigms: absolute exchanges, relative exchanges	231
19	The determination of wages	245

20 The circuit, the macroeconomic concept <i>par excellence</i> , is the identity of income's outflow and inflow	264

SYNOPSIS

of quantum macroeconomics	285
----------------------------------	-----

21 Production and time	287
------------------------	-----

22 Production and expenditures	295
--------------------------------	-----

23 Measurement in the economy and in economics	298
--	-----

24 The creation of money	307
--------------------------	-----

25 Capital	318
------------	-----

26 Inflation is a "malformation" of capital	333
---	-----

27 At the core, inflation is caused by the systematic dysfunction of fixed capital's amortization	340
---	-----

28 Production of the second sector, inflation is defined in quantum time; its measure in continuous time does not let the magnitude of the disorder become apparent	356
---	-----

29 Involuntary unemployment would necessarily be nil if the domestic economy did not include any dual production	363
--	-----

30 Neither inflation nor unemployment would exist in an economy where all monetary capital transits through financial markets	373
---	-----
